Hello GIT Hub Community:

As a Certified in Risk and Information Systems Control (CRISC), I am committed to guiding audiences through the intricate process of building a risk management program from scratch. The journey begins with establishing a strong governance framework to ensure alignment with organizational objectives and regulatory requirements. We then proceed to identify and assess potential risks using both qualitative and quantitative methods to prioritize risks based on their impact and likelihood. This assessment helps in designing tailored risk responses and control mechanisms to mitigate identified risks effectively. Throughout the program, continuous monitoring and reporting are emphasized to adapt to new threats and changes in the business environment. By integrating CRISC principles, the program not only enhances organizational resilience but also supports strategic decision-making, ensuring a holistic approach to risk management.

Regards,

Glenn Axelrod
